A Walkway Project Checklist

Projects can come about in a wide variety of ways, but a simple and effective approach is as follows:

- ✓ **Gain support.** Support of interested people, groups and stakeholders can make a significant difference in moving a project forward. Work with local, regional, and state planning and zoning bodies to identify rules, regulations, and permit needs early in the process to avoid unnecessary delays.
- ✓ **Identify route.** Identify the conceptual trail route using maps or aerial photos commonly available on the internet (Google Earth, MapQuest, Yahoo, Bing, etc.) or from Geographic Information System (GIS) software.
- ✓ **Conceptual plan.** Prepare a conceptual plan that outlines the purpose (what it will be used for), how the walkway will be used, and what will use it (bike/ped, maintenance equipment, emergency vehicles). Please see Developing Your Conceptual Plan by The Wickcraft Company.
- ✓ **Secure funding.** Identify funding sources and submit grant applications when appropriate. (see Greenway Project Funding Sources).
- ✓ **Site plan and preparation.** Often there is more to a project than just a walkway such as playgrounds, amenities, and hardscaping. Identify the general contractor or other resources that are responsible for site management and all construction and installation services.
- ✓ **Finalize walkway design.** Working with a Wickcraft project manager and design engineer, review and approve your walkway plan and layout.
- ✓ **Walkway Installation.** Your Wickcraft walkway will arrive on site. Each prefabricated section will be numbered corresponding to the walkway layout plan provided. (see The Wickcraft Installation Guide)
